Resend Notification

Description: In this topic, the user will learn how to resend notifications. When a message is sent, the recipient receives a notification. The notification can be viewed in the DCI messaging center, email (the email address associated with the user profile), and SMS text (if the mobile was verified). Notifications can be resent to the recipient as a reminder to read the message.

*Please note: The message status must be in unread to resend the notification. Resend message notifications feature is not available in the mobile app. Alt ernatively, for the mobile app and messages in a read status, reply to the original message, creating a new notification to the recipient.

Role Required: Employee (base user)

Permission Required: N/A
